Time-delay cosmography with lensed **quasars**

Challenges:
constrain lens mass
model & difficult to
increase quasar
sample

Wong et al. (2020)

Time-delay cosmography with lensed **supernovae**

ON THE POSSIBILITY OF DETERMINING HUBBLE'S PARAMETER
AND THE MASSES OF GALAXIES FROM THE GRAVITATIONAL
LENS EFFECT*

Sjur Refsdal

(Received 1964 January 27)

Time-delay cosmography with lensed **supernovae**

- 'Standard candles' (type Ia): extra magnification constraint
- Supernova fades away: better view of lens and host galaxy
- Well-defined light curves and shorter time delays: shorter monitoring required
- Learn about high-redshift supernova physics

ON THE POSSIBILITY OF DETERMINING HUBBLE'S PARAMETER
AND THE MASSES OF GALAXIES FROM THE GRAVITATIONAL
LENS EFFECT*

Sjur Refsdal

(Received 1964 January 27)

SN 'Refsdal': the first multiply-imaged lensed supernova

Kelly et al. (2015)

HST imaging data
Cluster MACS J1149.6

6% precision

H_0 estimate

Grillo et al. (2018)

3 more supernovae lensed by galaxy clusters...

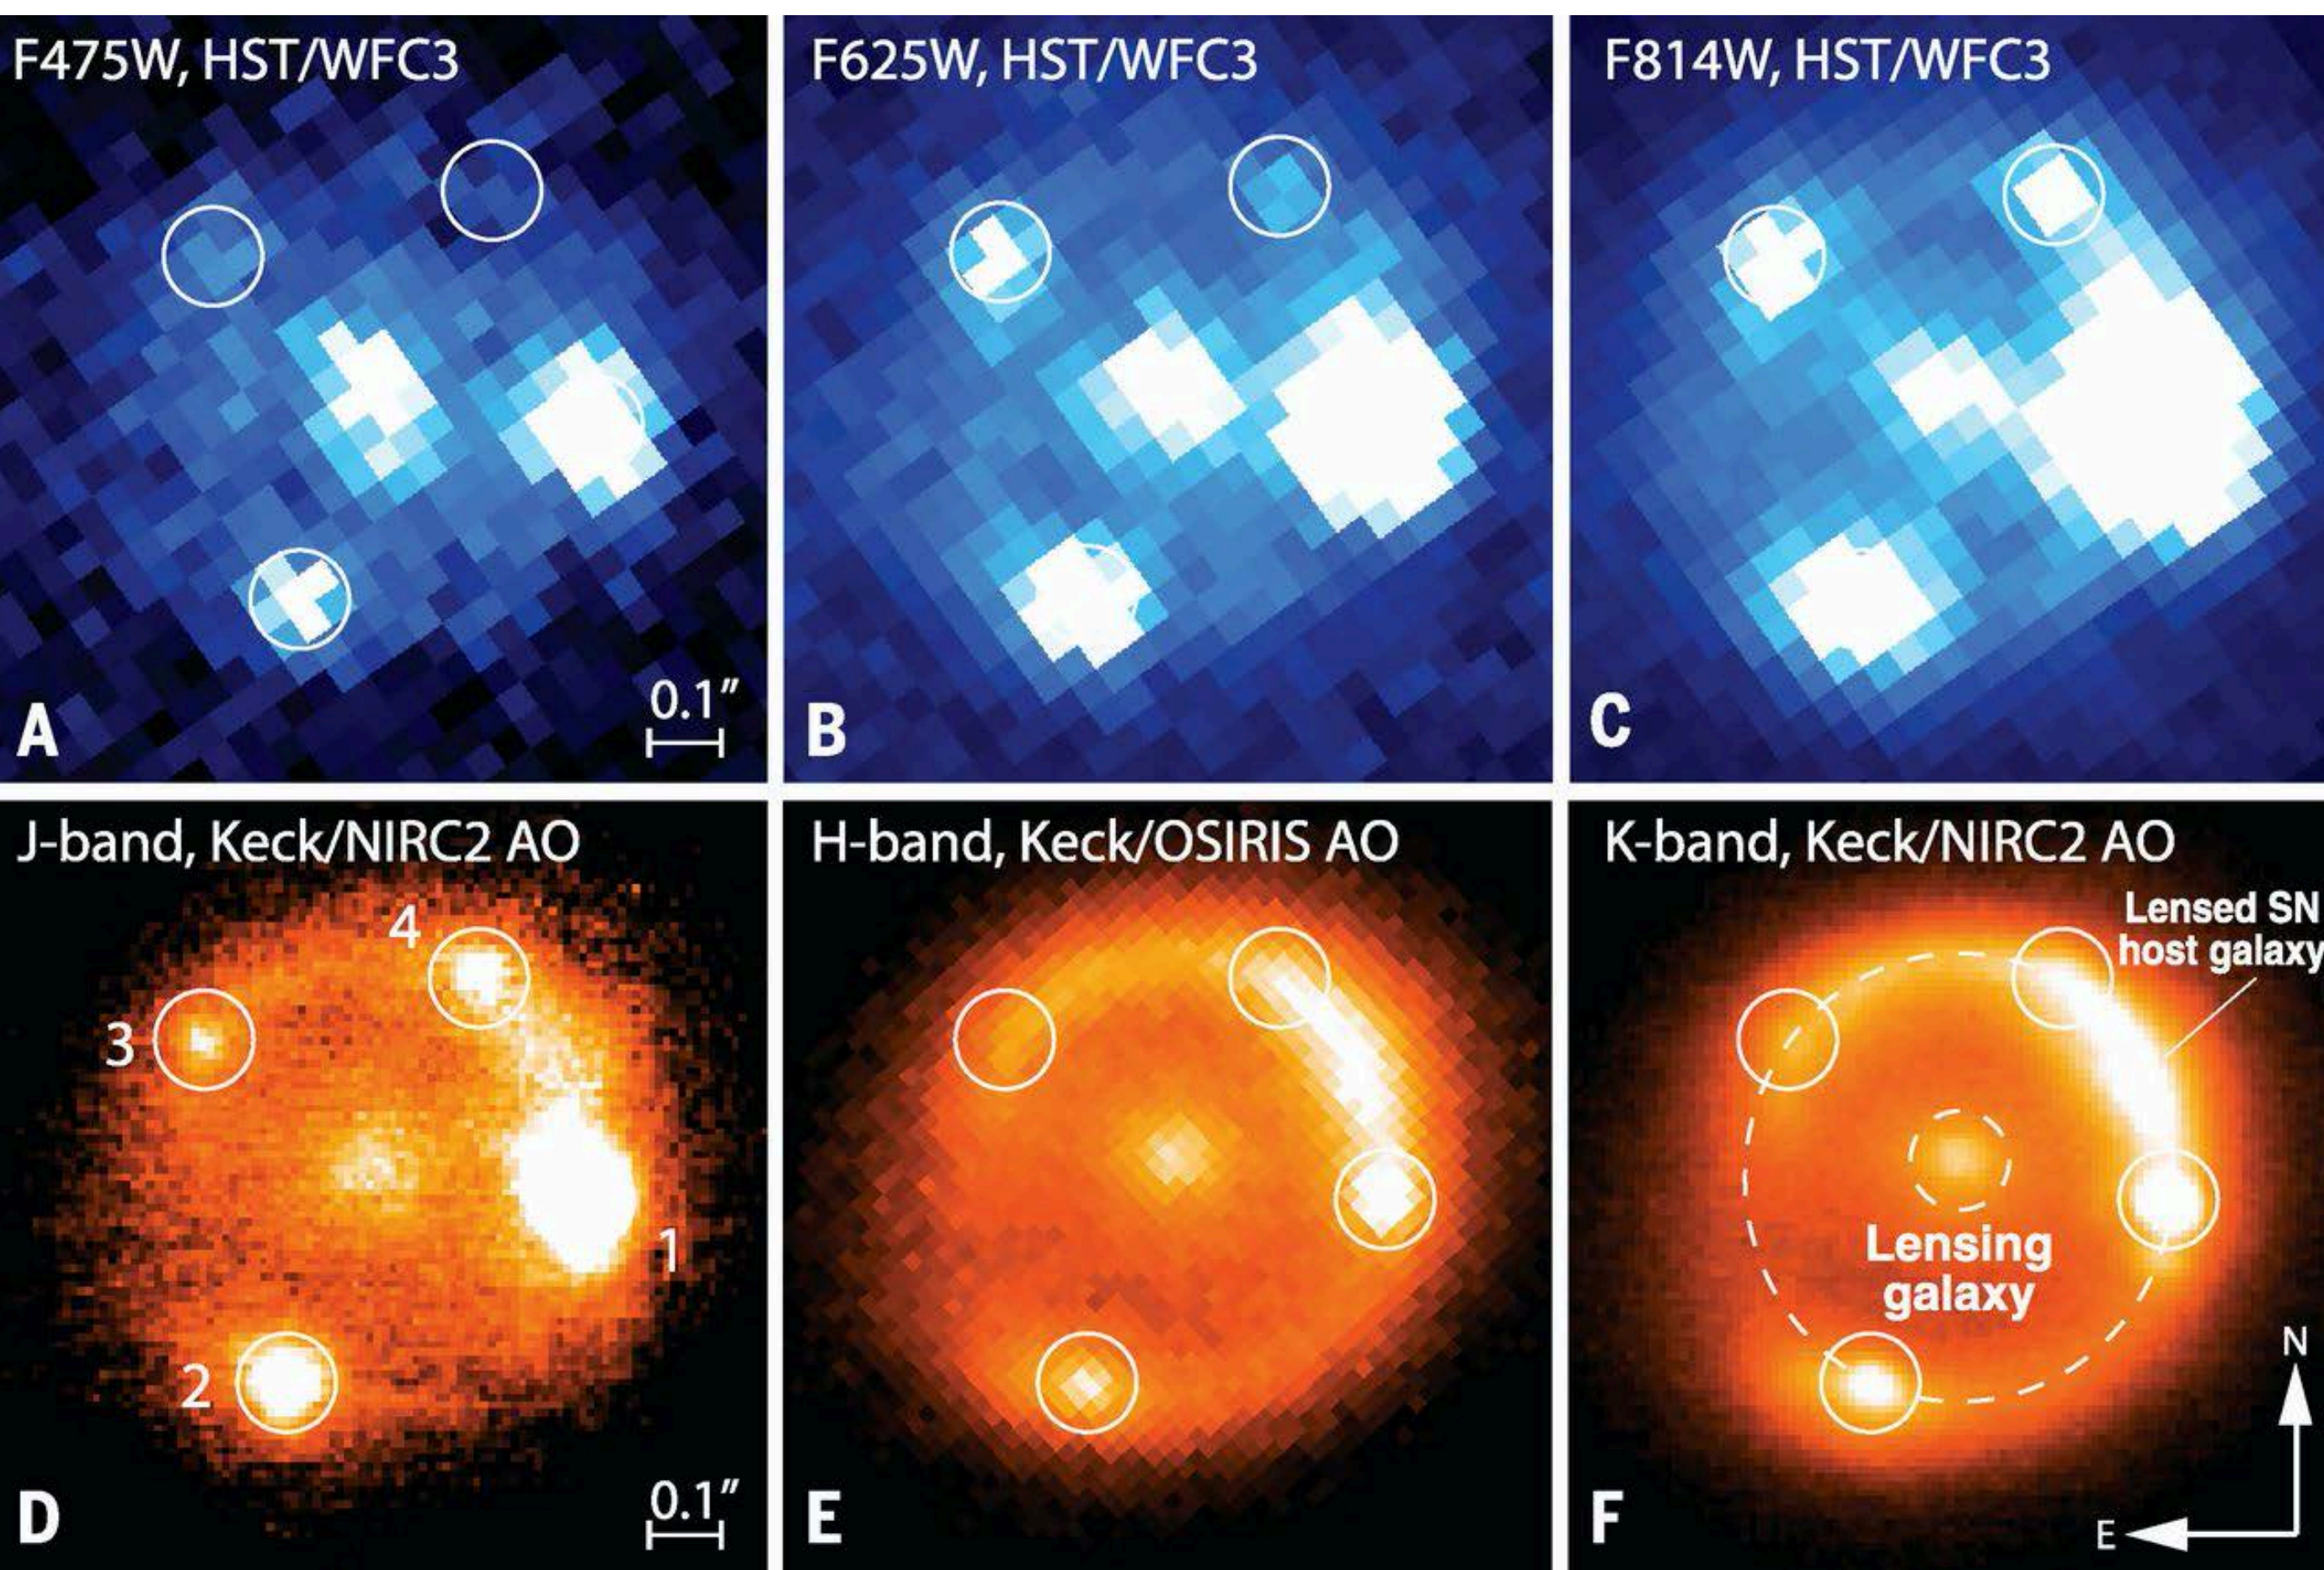

...and two lensed
by single galaxies

iPTF16geu

(Goobar et al. 2017)

$\Delta t \sim 1.5$ day

SN Zwocky

(Goobar, Johansson, Schulze,
Arendse, et al. 2023)

$\Delta t < 1$ day

*LSST: Galaxy survey
starting in ~2024 that
will map the Southern
sky in u,g,r,i,z,y bands
in unprecedented
depth*

Predicted yearly lensed SN rates with the Vera Rubin Observatory:

89 Ia and 250 core collapse

Wojtak et al. (2019)

*LSST: Galaxy survey
starting in ~2024 that
will map the Southern
sky in u,g,r,i,z,y bands
in unprecedented
depth*

Challenge: **detection**

Unresolved

Visually very similar to
unlensed transients

Partially resolved

Not point-like anymore:
danger of being discarded
by detection algorithms!

Resolved

Outnumbered by false
positives & difficult to
identify early

Synergy with static science: cross-match with known lenses

Unresolved

Visually very similar to
unlensed transients

Partially resolved

Not point-like anymore:
danger of being discarded
by detection algorithms!

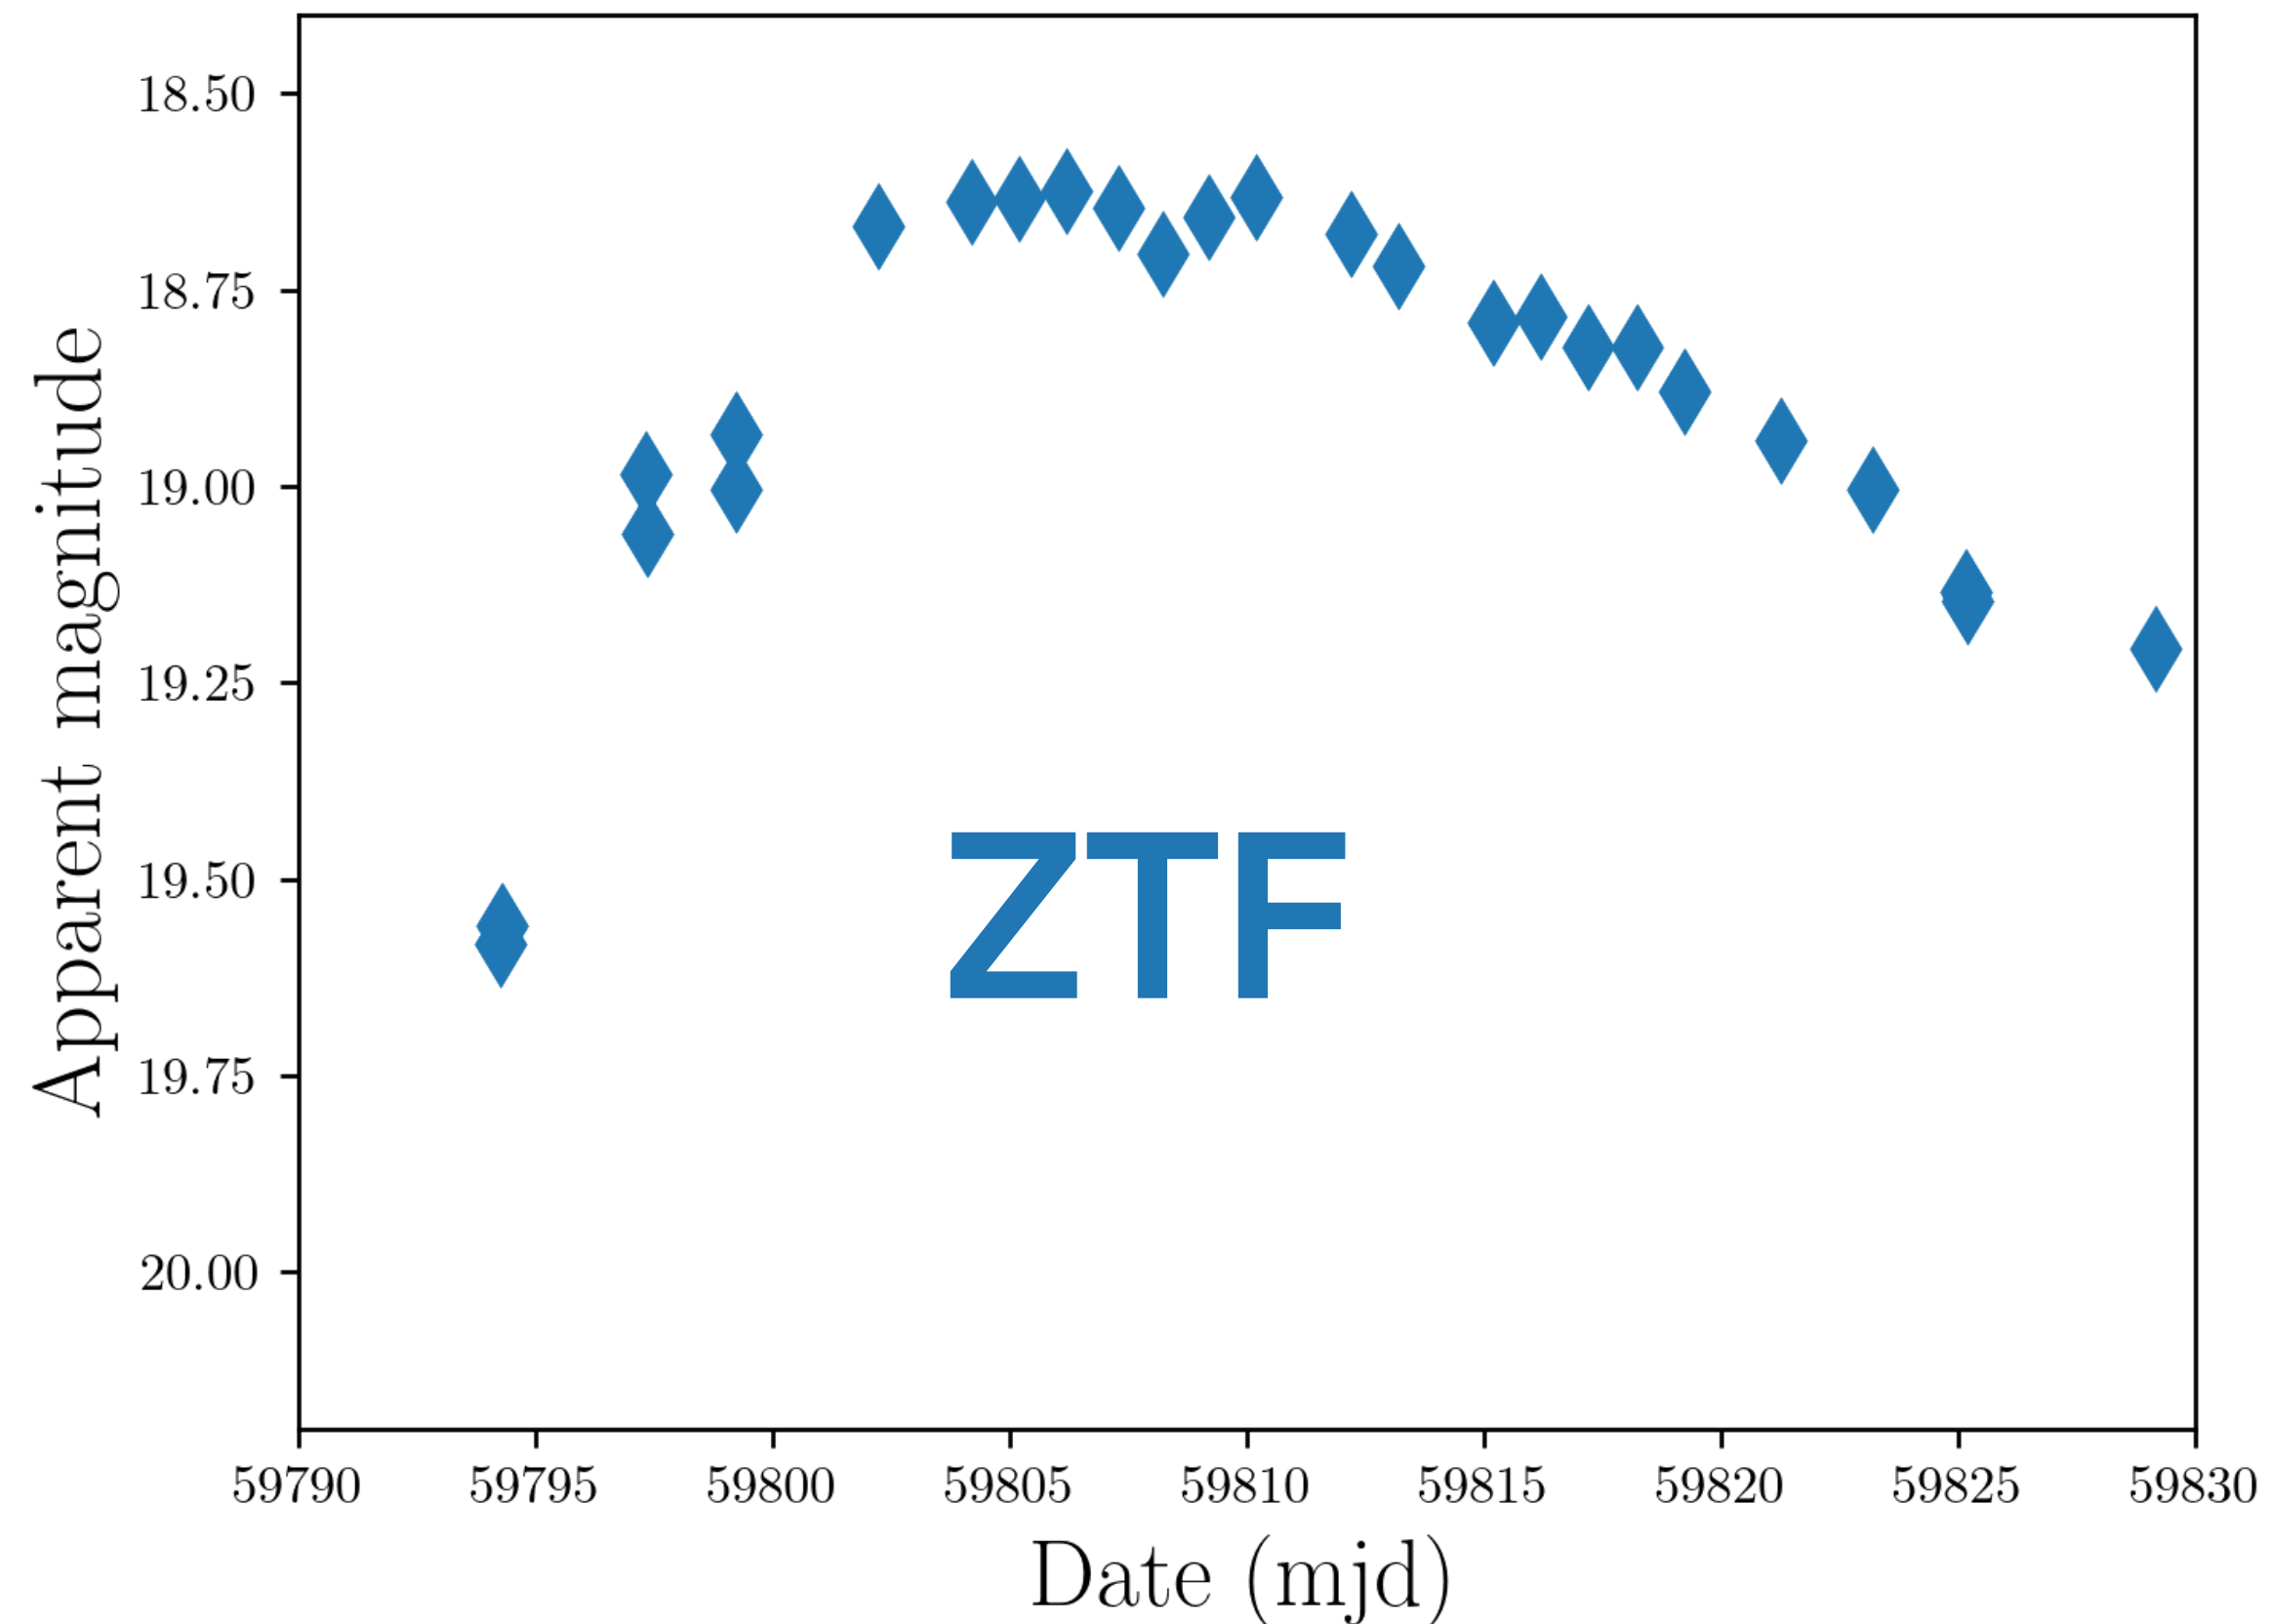

Resolved

Outnumbered by false
positives & difficult to
identify early

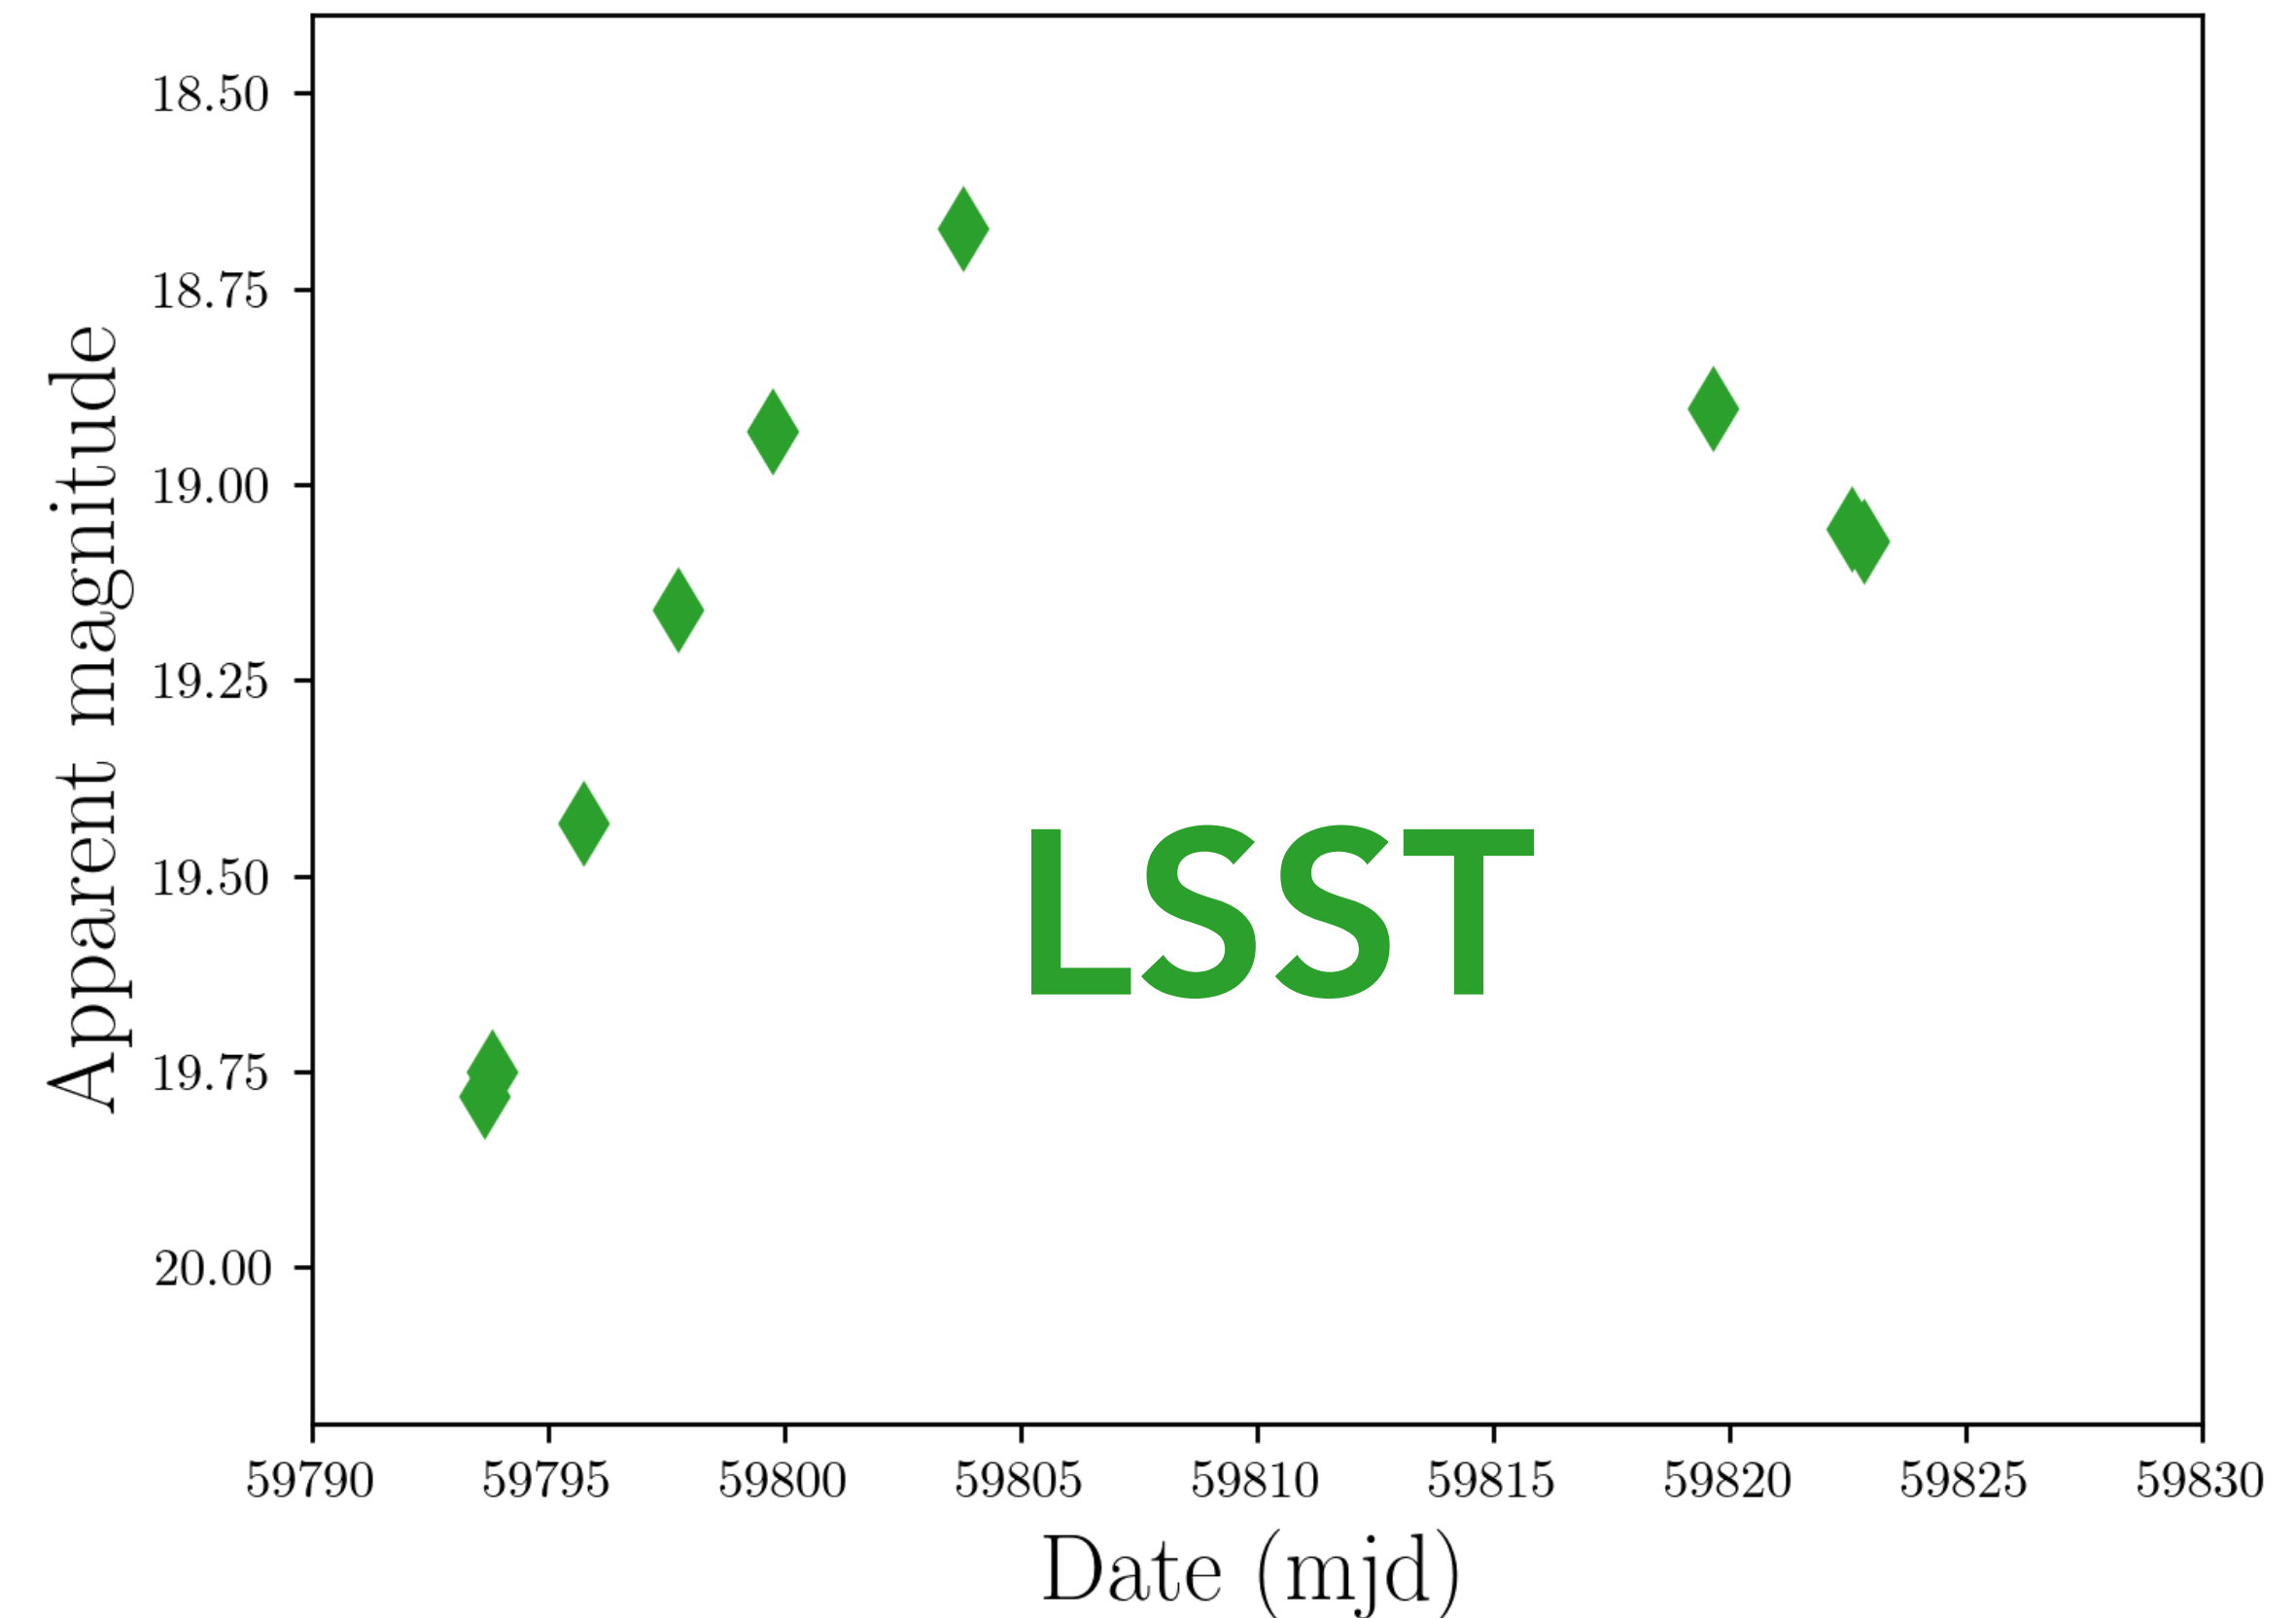

Challenge: observing strategy

SN Zwicky observed in *r*-band

Median inter-night gap: 2 days

SN Zwicky simulated in *r*-band

Median inter-night gap:

r-band: 6 days,

i-band: 8 days

z-band: 9 days,

y-band: 12 days

Challenge: **follow-up resources**

Spectrum: identify SN type and redshift to verify it's lensed

Multiple epochs of imaging: sample the light curve

High-resolution image (HST, Keck, JWST): constrain image positions and lens mass model

Finder's Guide to lensed type Ia supernovae in LSST

Nikki Arendse, Suhail Dhawan, Ana Sagués Carracedo, Hiranya Peiris, Ariel Goobar, et al.

How many lensed SNe will be observed?

Taking into account the newest observing strategy

Sky pointings

Year 3, Baseline v3.0 cadence
(LSST observation scheduler OpSim)

How many lensed SNe will be observed?

Taking into account the newest observing strategy

Sky pointings

Doubly-imaged supernova

Year 3, Baseline v3.0 cadence
(LSST observation scheduler OpSim)

Predicted yearly lensed SN rates with the Vera Rubin Observatory:

Wojtak et al. (2019): 89 SNIa / year

Predicted yearly lensed SN rates with the Vera Rubin Observatory:

Wojtak et al. (2019): 89 SNIa / year

Baseline v3.0
(preliminary): 46 SNIa / year

Predicted yearly lensed SN rates with the Vera Rubin Observatory:

Wojtak et al. (2019): 89 SNIa / year

Baseline v3.0
(preliminary): 46 SNIa / year

$\Delta t > 10$ days: 31 SNIa / year

What is the impact of the rolling cadence?

What is the impact of the rolling cadence?

Non-rolling \longrightarrow more lensed SNe
Rolling \longrightarrow denser light curve sampling

How many will stand out from unlensed SNe?

In terms of brightness, colours, and light curve shapes

Ana Sagués
Carracedo

How many will stand out from unlensed SNe?

In terms of brightness, colours, and light curve shapes

Ana Sagués
Carracedo

Redshift distributions of lensed and unlensed supernovae in LSST show large overlap:
observed colours are similar!

How many will stand out from unlensed SNe?

In terms of brightness, colours, and light curve shapes

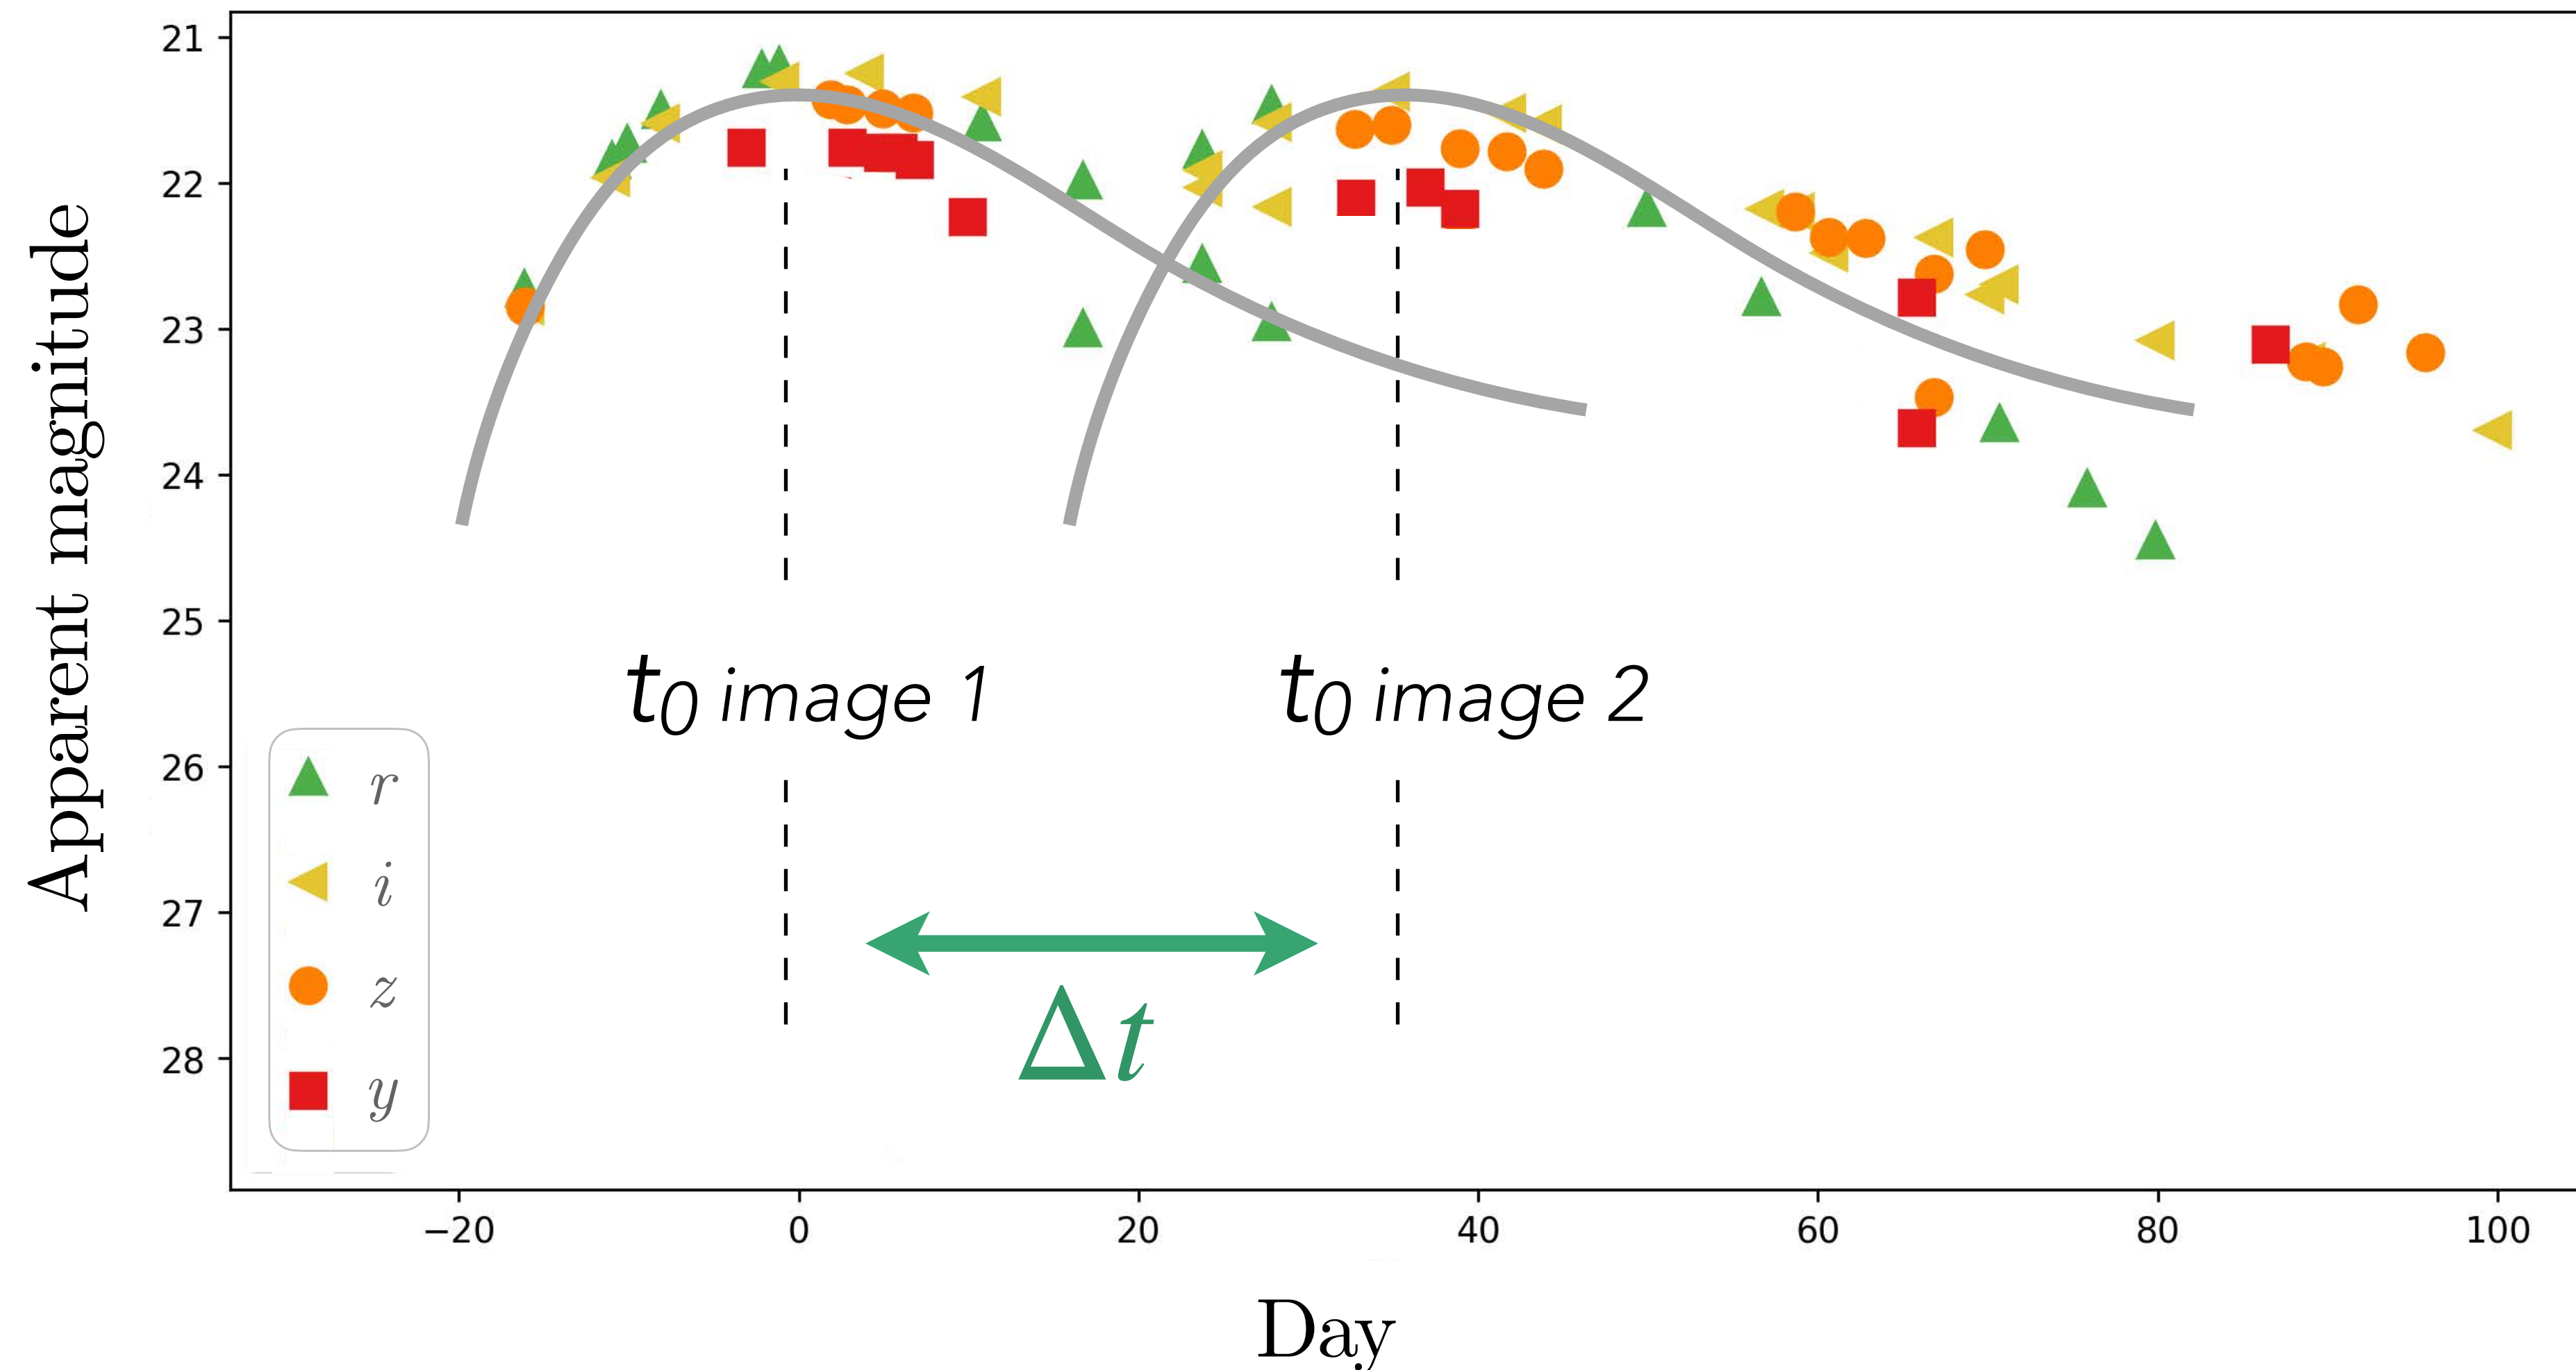

Ana Sagués
Carracedo

Redshift distributions of lensed and unlensed supernovae in LSST show large overlap:
observed colours are similar!

How many will have well-measured time delays?

Use SALT2 to fit resolved lensed supernova light curves

Suhail Dhawan

How many will have well-measured time delays?

Use SALT2 to fit resolved lensed supernova light curves

Suhail Dhawan

How many will have well-measured time delays?

Use SALT2 to fit resolved lensed supernova light curves

5 - 8 % of the systems have time-delay estimates within a day accuracy

Only from LSST data, without follow-up!

Suhail Dhawan

Want to get involved preparing for lensed SNe with LSST?

Justin Pierel

We're developing a **Strong Lensing** simulation pipeline for realistic, scalable, and flexible simulations to test lens finders and cosmology tools

- Bi-weekly telecons on Monday at 16 GMT with the lensed SN team
- Slack channel: **#lensed-sn-integration**

Conclusions

- Lensed supernovae: promising cosmological probes but many challenges to overcome related to identification
- **Lensed supernova Finder's Guide:**
 - ~ 46 lensed SNIa / year in LSST (using Baseline v3.0 cadence)
 - Rolling cadence: ~ 15% fewer objects but denser light curve sampling
 - Require both colours and magnitudes to separate lensed/unlensed SNIa
 - A few objects per year with well-measured time delays only from LSST

The future is bright for lensed supernovae
